

## The Value of Expression

### Problem Description

Two operations are defined for 1-bit binary variables:

| The Operator | Algorithm        |
|--------------|------------------|
| $\oplus$     | $0 \oplus 0 = 0$ |
|              | $0 \oplus 1 = 1$ |
|              | $1 \oplus 0 = 1$ |
|              | $1 \oplus 1 = 1$ |
| $\times$     | $0 \times 0 = 0$ |
|              | $0 \times 1 = 0$ |
|              | $1 \times 0 = 0$ |
|              | $1 \times 1 = 1$ |

The precedence of the operation is:

1. Evaluate what is inside the parentheses first, then evaluate what is outside parentheses.
2. “ $\times$ ” operation has higher precedence than “ $\oplus$ ” operation, that is, when evaluating the operation, evaluate  $\times$  operation first, then evaluate  $\oplus$  operation.

For example, when evaluating  $A \oplus B \times C$ , first evaluate  $B \times C$ , then compute the result with A using the operator  $\oplus$ .

Now given an unfinished expression, such as  $\_+(\_ \* \_)$ , please fill in the number 0 or 1 in the horizontal line. How many ways are there to make this expression equal to 0?

### [Explanation for Sample Input and Output]

The given expression includes the horizontal lines :  $\_+(\_ \* \_)$

When filling in (0, 0, 0), (0, 1, 0), (0, 0, 1), the value of the expression is 0. Therefore, there are 3 ways of filling in.

### [Constraints]

For 20% of the data,  $0 \leq L \leq 10$ .

For 50% of the data,  $0 \leq L \leq 1,000$ .

For 70% of the data,  $0 \leq L \leq 10,000$ .

For 100% of the data,  $0 \leq L \leq 100,000$ .

For 50% of the input expression, there are no parentheses.

### Input

The first line is an integer L, which indicates the number of operators and parentheses in the given expression excluding the horizontal line.

The second line is a string including L characters, which only contains 4 kinds of characters: ‘(’, ‘)’, ‘+’, ‘\*’. In which, ‘(’ and ‘)’ are left and right parentheses, and ‘+’ and ‘\*’ represents the operators defined above: “ $\oplus$ ” and “ $\times$ ”. This line of characters gives the operators and parentheses in a given expression in order, excluding variables.

**Output**

Containing a positive integer, that is, the total number of solutions. Note: This could be a very large number, please output the result of the number of schemes modulo 10007.

**Sample Input**

4

+(\*)

**Sample Output**

3
